# Routine requests and exceptions follow different routes

**A conditional route**

Fictional purchasing process

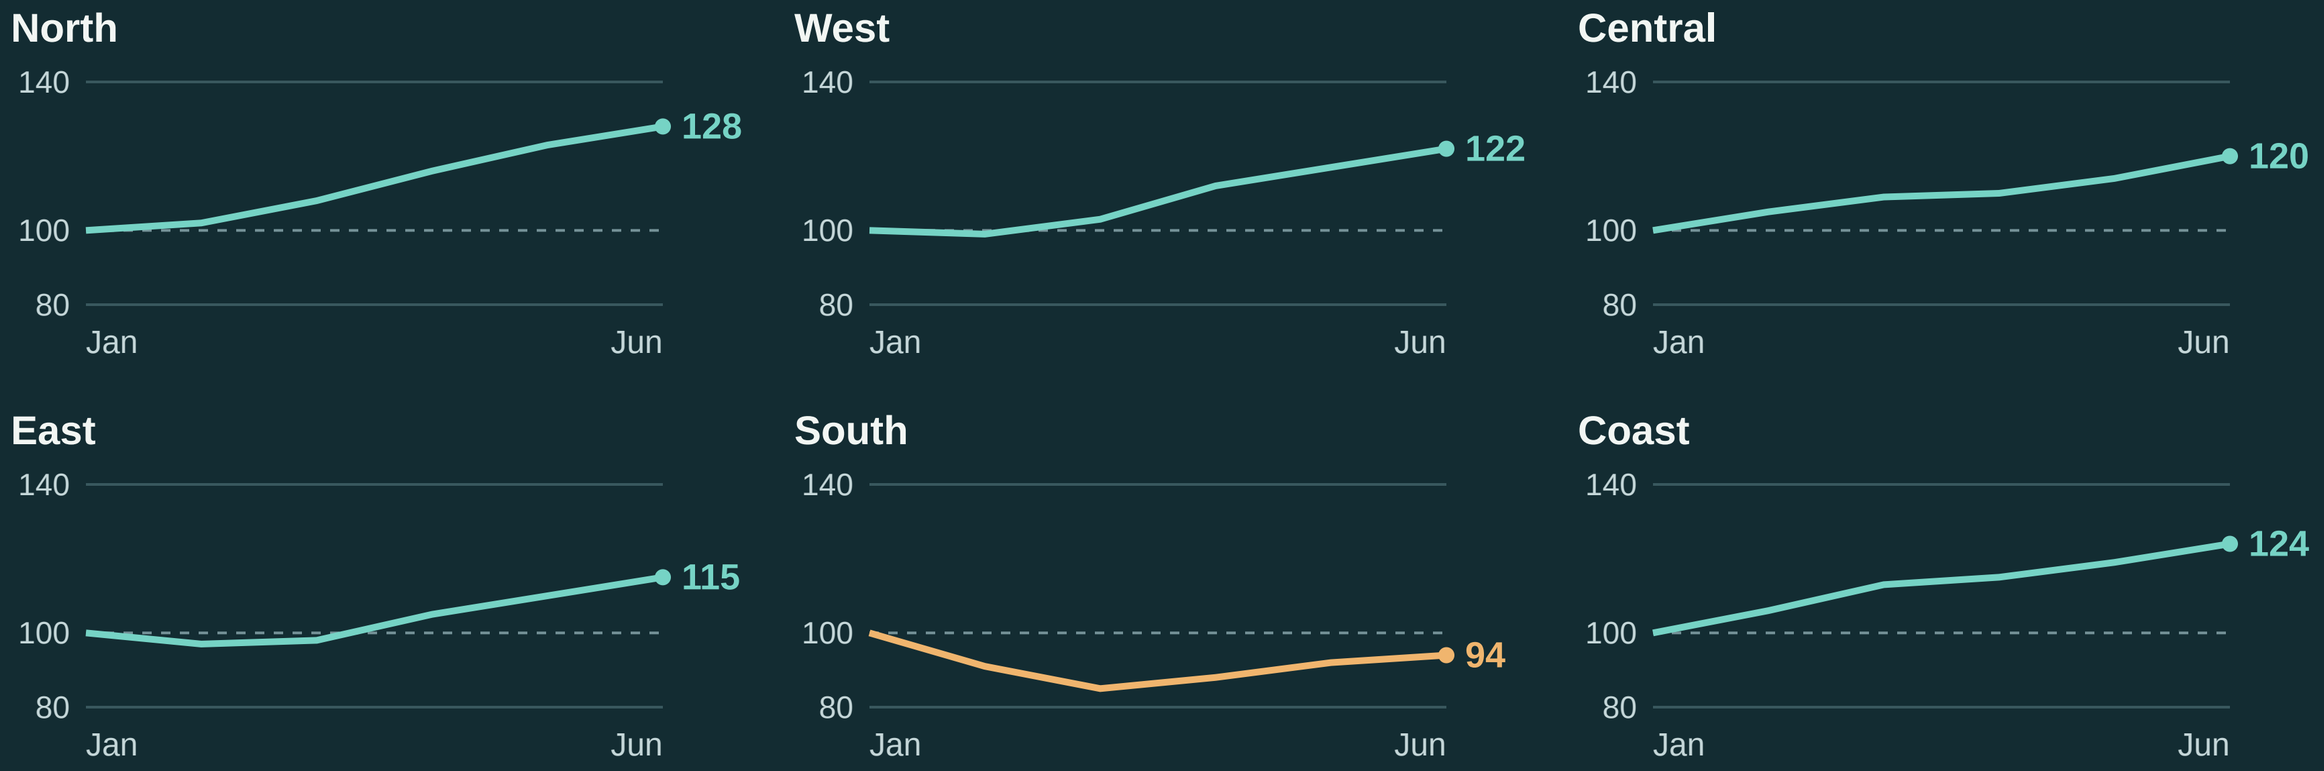

Lanes identify responsibility. Branches and labels explain the rule and the return path.

Illustrative process. Connections describe a fictional workflow; no throughput or timing is implied.

# Service completion trends differ across six regions

Service completion index. January = 100.

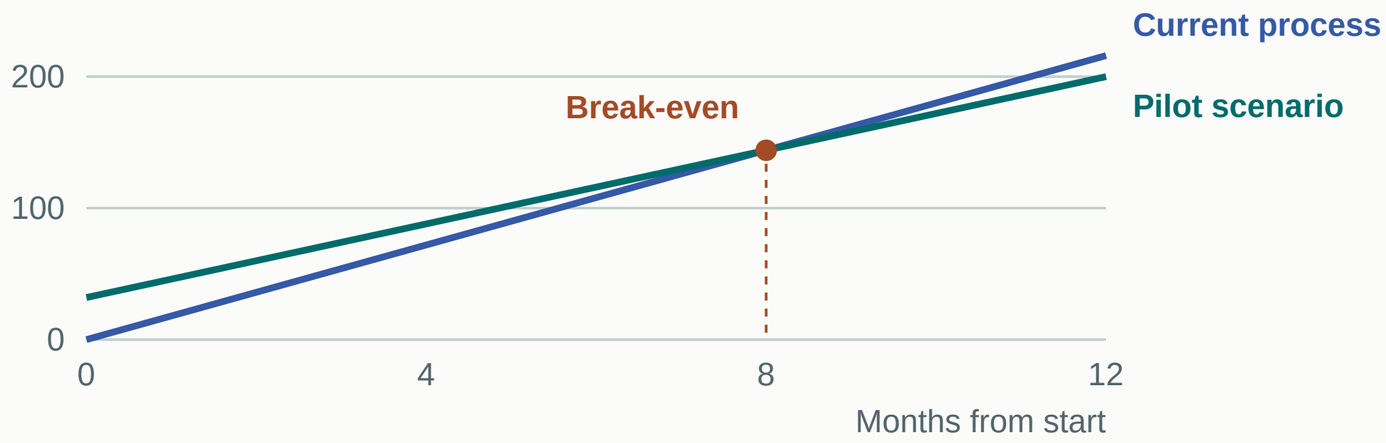

All panels use 80–140

Synthetic index series for design demonstration. January–June; no real locations or operational results.

# An eight-month payback depends on the assumed saving

Cumulative cost, € thousands

| Assumption | Current | Pilot |
|---|---|---|
| One-time setup cost | €0k | **€32k** |
| Recurring cost per month | €18k | **€14k** |
| Cumulative cost at month 12 | €216k | **€200k** |

**Decision assumption**

# 8 months

€32k setup cost divided by €4k assumed monthly saving.

## What changes the result

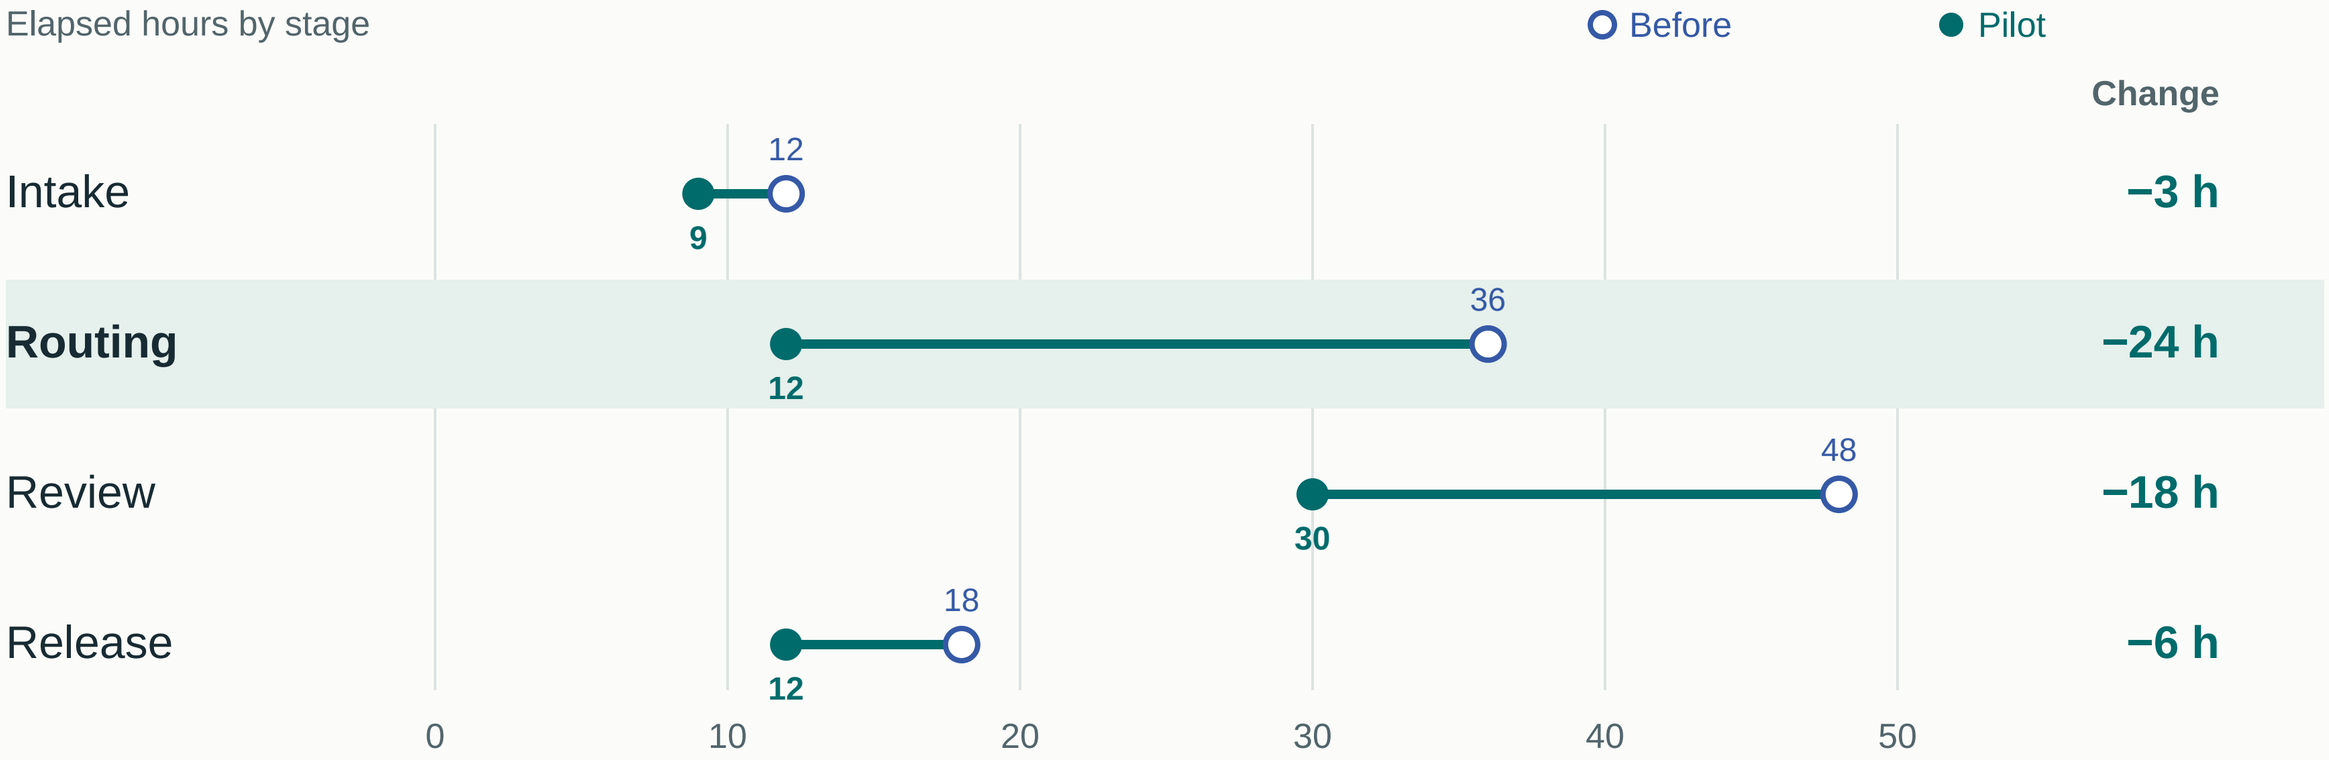

The saving must persist after launch. Training and integration costs may extend the payback period. This comparison excludes discounting and any changes in service quality.

**A pilot would test the cost assumption before a wider rollout.**

Illustrative planning assumptions, not a forecast. €32k ÷ €4k/month = 8 months. All values are synthetic.

# Routing shows the largest reduction in the pilot scenario

Elapsed hours by stage

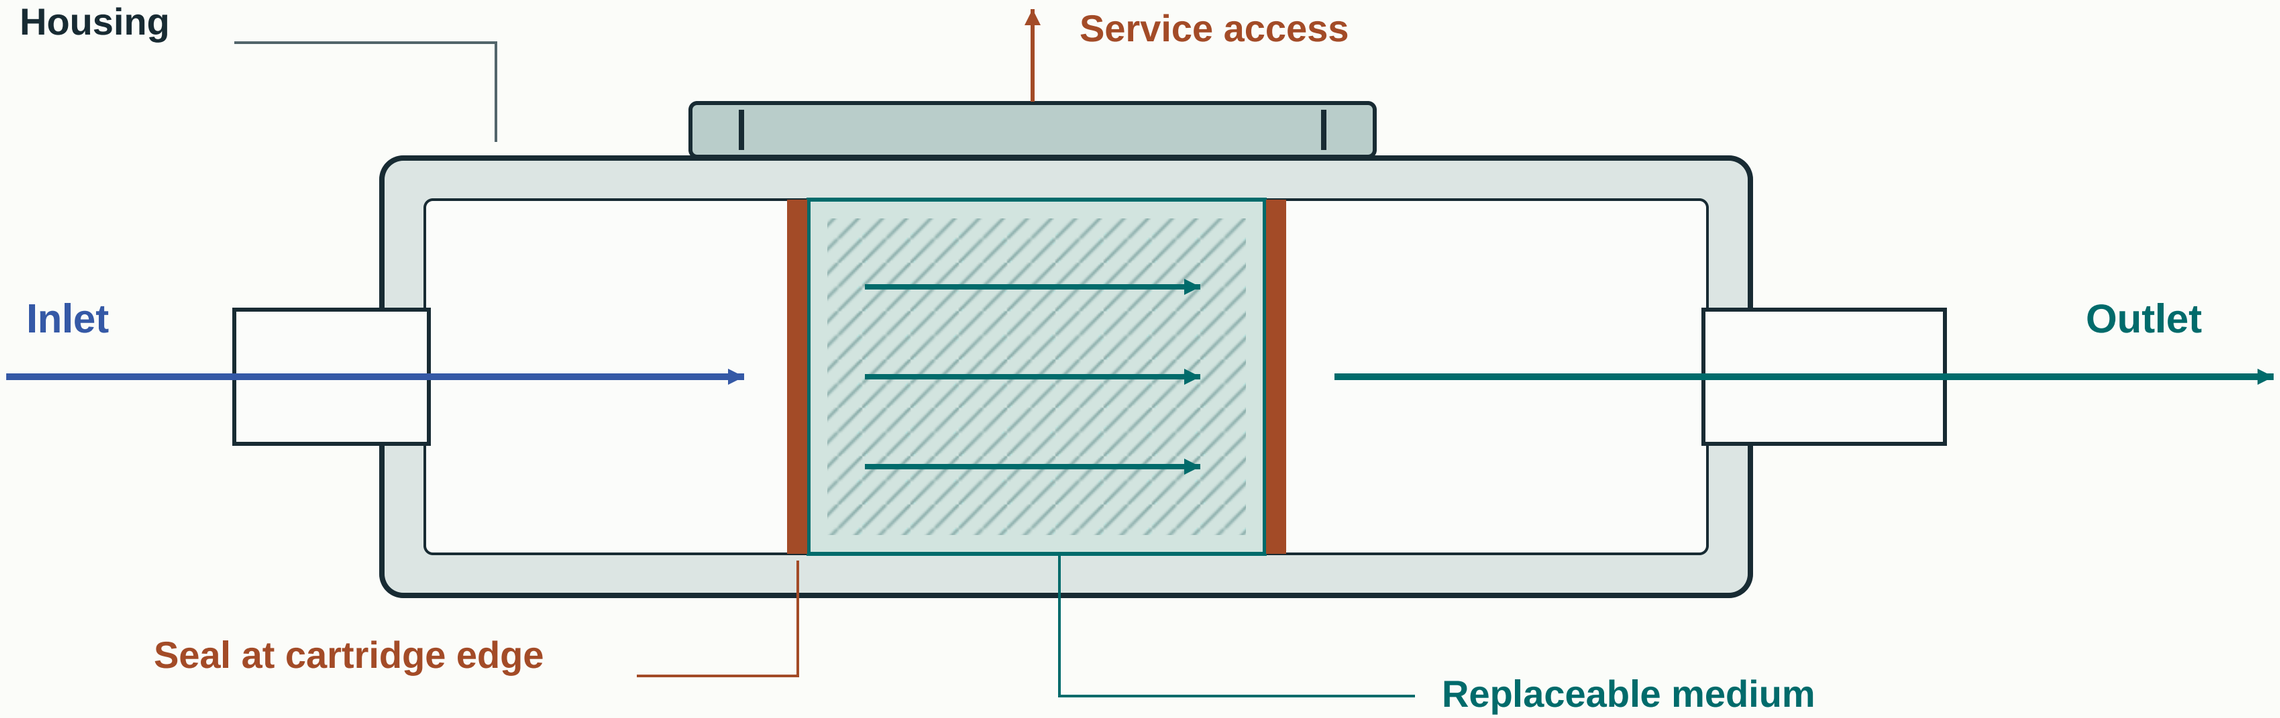

The shared scale makes the absolute reduction visible; matched stages keep the comparison fair.

Synthetic before/pilot values. Same stage definitions and hours in both scenarios; no observed performance claim.

# A section view reveals the seal, medium and flow path

Section through a fictional filter assembly

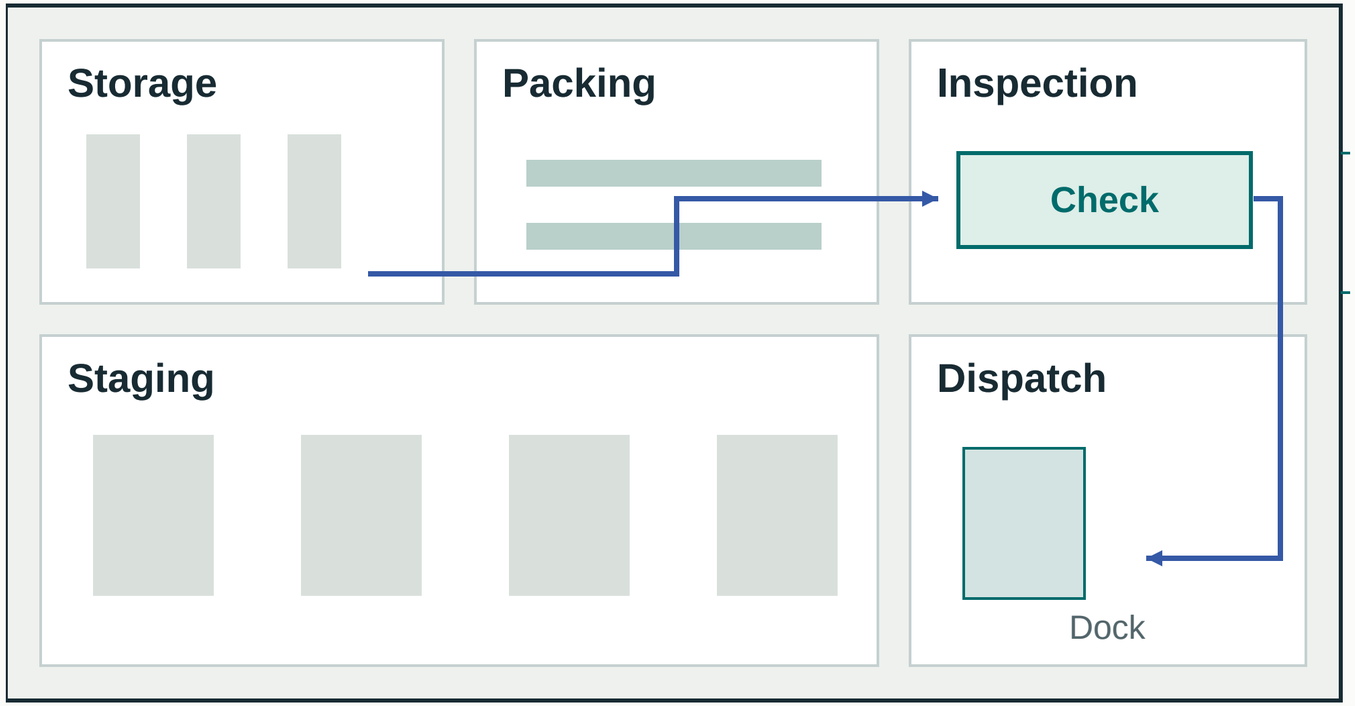

Schematic, not to scale

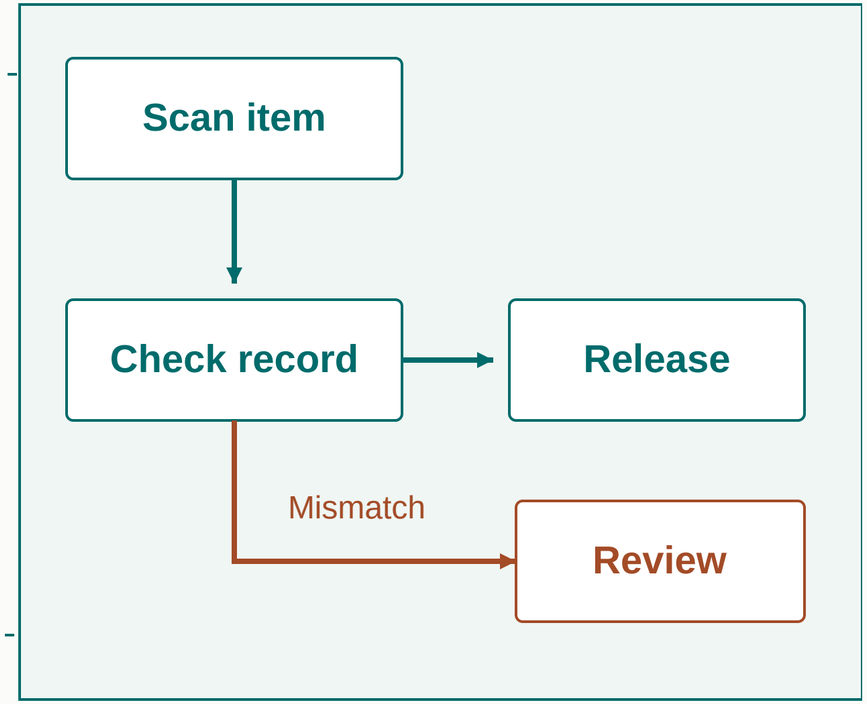

Labels attach to the feature they explain. Flow arrows show direction without implying measured rates.

# Inspection sits between packing and dispatch

## Facility overview

## Inspection detail

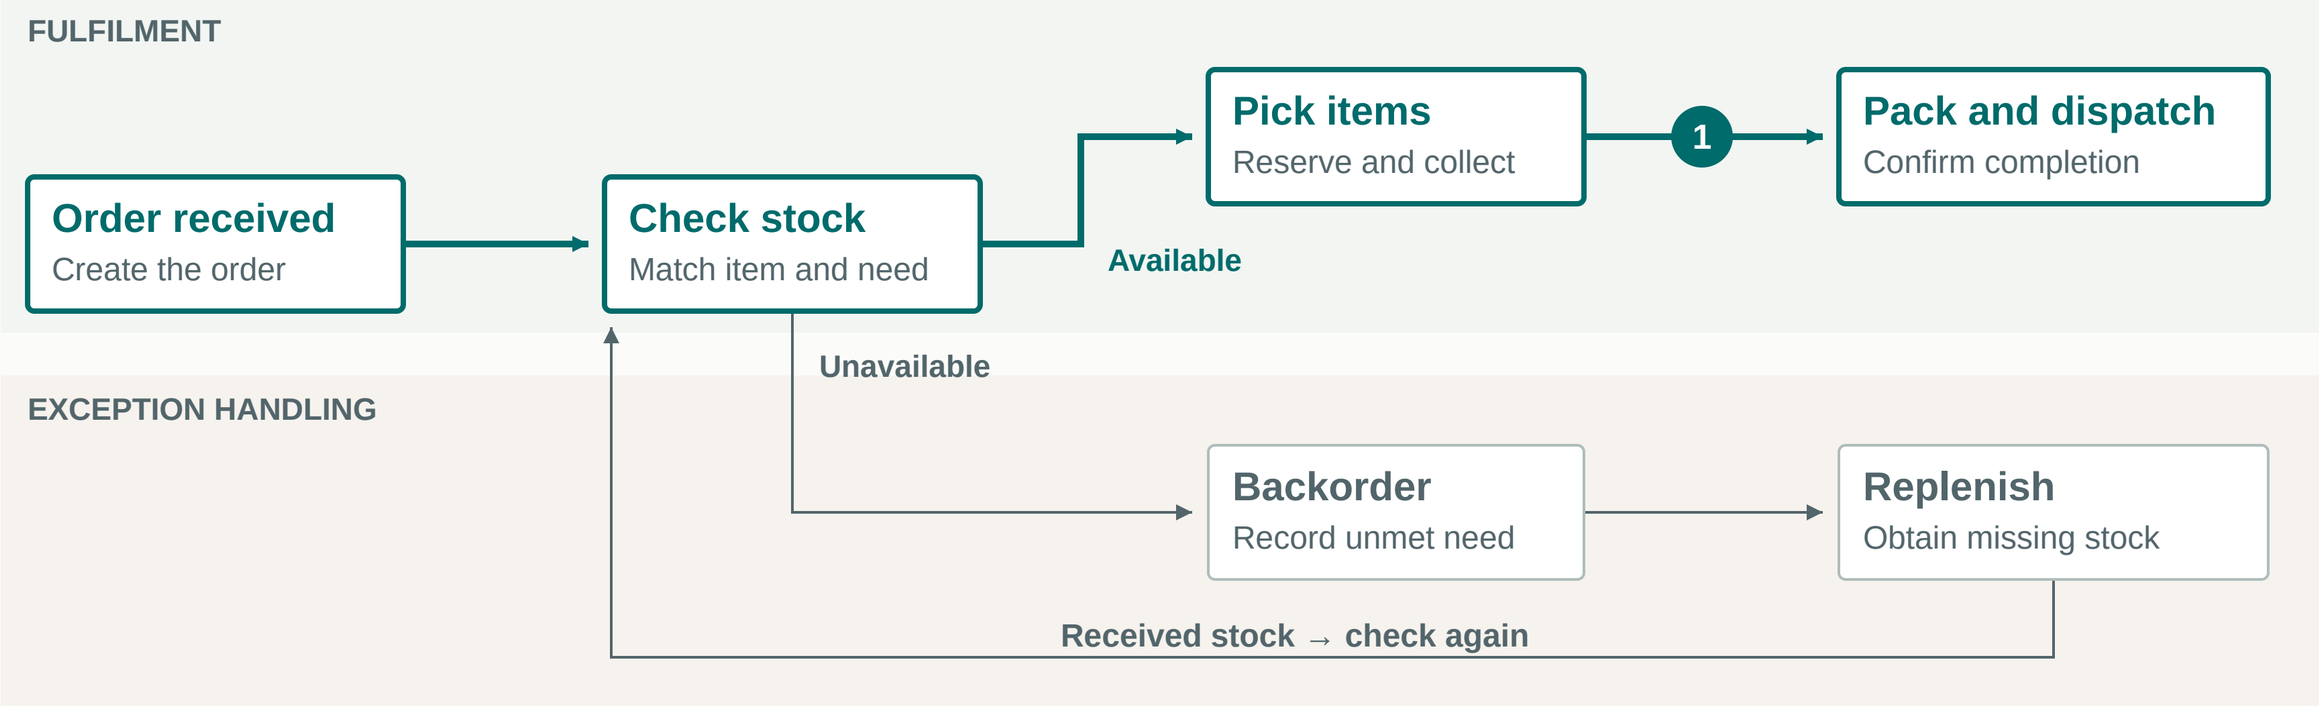

The overview establishes location. The inset explains what happens at the checkpoint.

Fictional facility plan and workflow. Positions are schematic and do not represent a real site or measured distance.

# Available stock follows the fulfilment route

**1** **Follow the available-stock route**

Same system • same positions

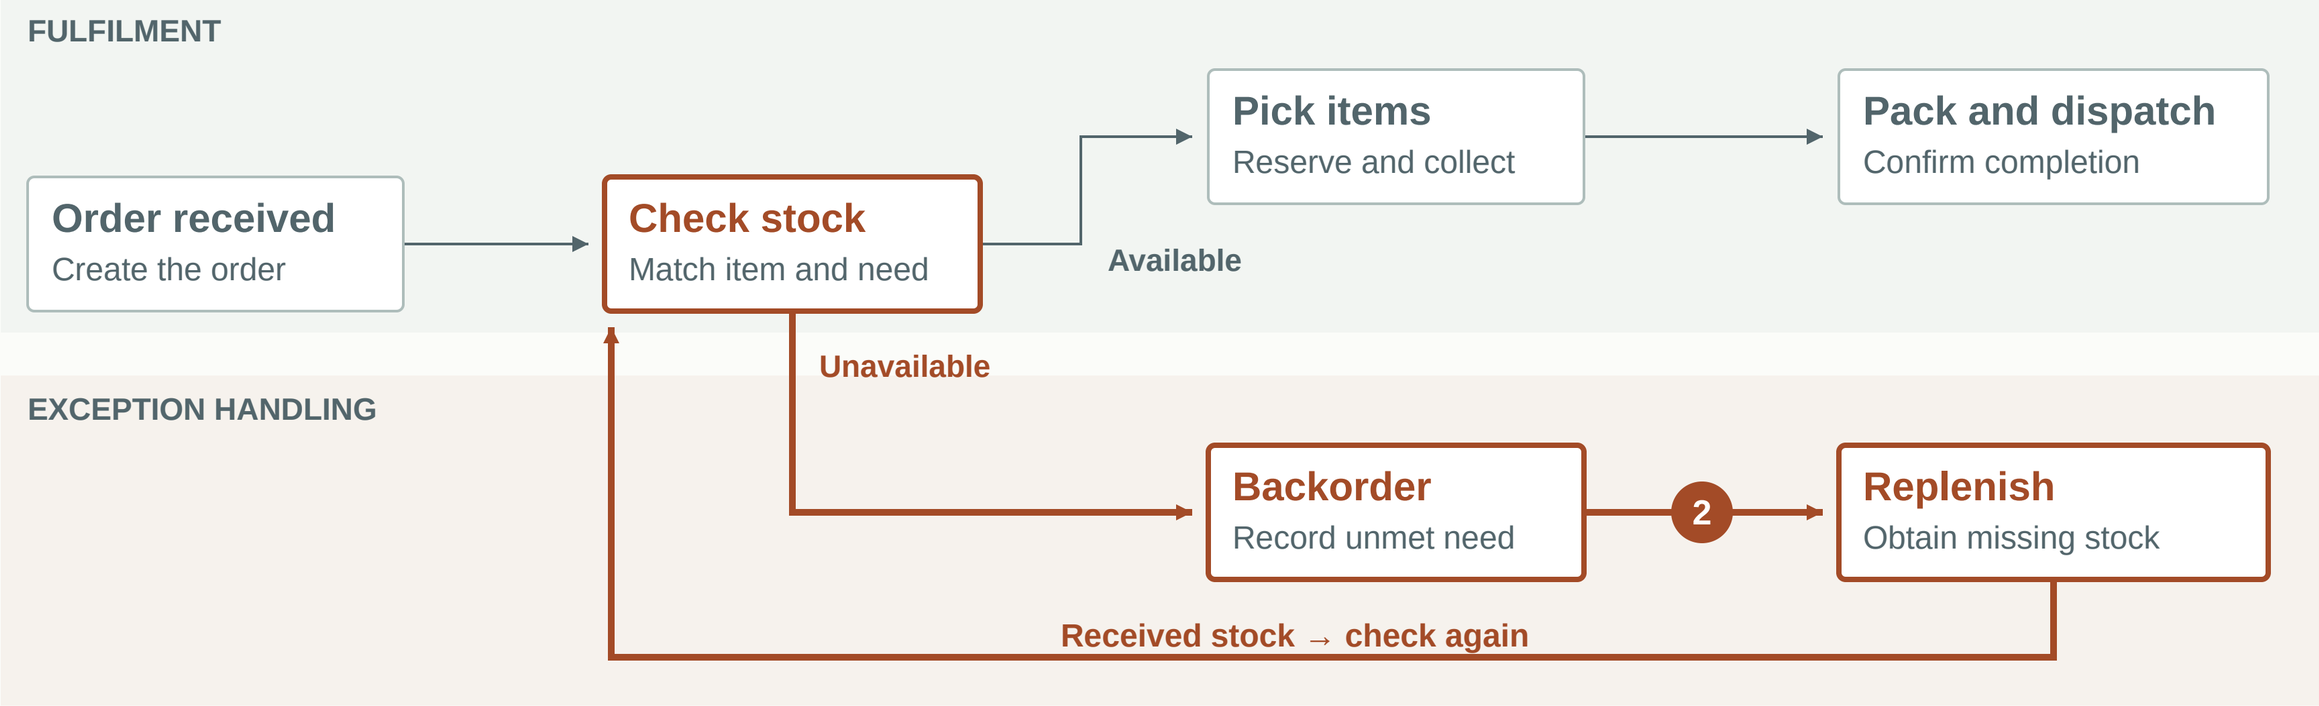

Available stock moves through picking and dispatch; the exception loop remains visible.

Fictional workflow. Route emphasis changes between pages; positions, conditions and connections stay fixed.

# Unavailable stock returns through replenishment

## 2 Follow the replenishment loop

Same system • same positions

Missing stock creates a backorder; replenishment returns to the same stock check.
